Comments on TN266v2.1 by Akira Konaka

- There are slightly different narrations on the CP results in this technote. Could we say that CP conservation assuming the PMNS framework is excluded at 90%CL?
L1201: "$\delta_{CP} = 0$ is still disfavored with respect to $\delta_{CP} = \pi$, which, however, is excluded at 90% CL. We can say that CP conservation is excluded at 90% CL."
L1217: "With the Run 1-7 data set we still cannot exclude the hypothesis of CP conservation with a good significance."
L1266: "The Run 1-7 data do not exclude the hypothesis of CP conservation, though $\delta_{CP} = 0$ is excluded at more than 2σ and $\delta_{CP} = \pi$ is excluded at 90% CL."

I modified the tree sentences in the text. Now I do not talk about "good significance" which is quite subjective but I only state the significance to which $\delta_{CP} = 0$ and π are excluded and that CP conservation with the PMNS model is excluded at 90% CL.
