1. To all three TN authors: could you please discuss consistency of your analysis results with others? For example, the p-theta and Valor can compare their p-values, especially by using rate-only p-values. According to the Kirsty's presentation at 18June15 analysis meeting, Valor and MaCh3 can be compared by using likelihood ratio Bayes Factor. Such information should also be included in the technotes as a record. It is also nice if p-theta can be compared with MaCh3 as well (although I don't know it is possible or not).

   DONE. Added a short section at the end of the technical note.
